I. COURSE OVERVIEW:

Stochastic or random processes are mathematical objects defined on probability space. The study of these processes is of primary importance in all science and engineering specializations. This course comprises two parts. The first part introduces the fundamental principles of probability theory and random variables necessary to understand the stochastic processes. The second part introduces the basic concepts of random processes, random signals, and their interaction with the electrical or electronic systems. The course forms the basis for the next level courses of an electronics engineer such as analog communication, digital communication and digital signal processing, radar systems and digital image processing. It is also useful for a data science engineer in designing the machine learning algorithms.

II. OBJECTIVES:

The course should enable the students to:

- The fundamental concepts of the 1-dimensional and 2-dimensional random variables and their characterization in probability space.
- The stationary random process, its framework and application for analyzing random signals and noises.
- The characteristics of 1-dimensional stationary random signals in time and frequency domains.
- Analysis of the response of a linear time invariant (LTI) system driven by 1- dimensional stationary random signals useful for subsequent design and analysis of communication systems.

III. COURSE OUTCOMES:

After successful completion of the course, students should be able to:

CO 1	Infer the concepts of the random experiment, event probability, joint event probability, and conditional event probability for proving the Bayes theorem and for computing complex event probabilities and independence of multiple events.	Understand
CO 2	Explain the concept of random variable, the probability distribution function, probability density function and operations on single random variable to analytically derive the moments.	Understand
CO 3	Develop joint distribution, density function, expectation operator and transformations for multiple random variables using the concept of single random variable.	Apply
CO 4	Extend the random variable concept to random process and its sample functions for demonstrating the time domain and frequency domain characteristics.	Understand
CO 5	Develop analytically the auto-power and cross- power spectral densities to solve the related problems of random processes using correlation functions and the Fourier transform.	Apply
CO 6	Analyze the response of a linear time invariant (LTI) system driven by stationary random processes using the time domain and frequency domain description of random processes.	Analyze

IV. SYLLABUS:

MODULE - I	PROBABILITY, RANDOM VARIABLES AND OPERATIONS ON RANDOM VARIABLES	Classes: 09
Random Experiments, Sample Spaces, Events, Probability, Axioms, Joint, Conditional and Total Probabilities, Bay's Theorem, Independent Events. Random Variables: Definition, Conditions for mapping function of a Random Variable, Types of Random Variable, Distribution and Density functions: Definition and Properties, Binomial, Poisson, Uniform, Gaussian, Exponential, Rayleigh, random variables, Methods of defining Conditioning Event, Conditional Distribution, Conditional Density and their Properties, Expected Value of a Random Variable, Function of a Random Variable, Standard and Central Moments, Variance and Skew, Chebychev's Inequality		

MODULE - II	SINGLE RANDOM VARIABLE TRANSFORMATIONS - MULTIPLE RANDOM VARIABLES	Classes: 09
Characteristic Function, Moment Generating Function, Monotonic and Non-monotonic Transformations of Single Random Variables (Continuous and Discrete), Vector Random Variables, Joint Distribution Function and its Properties, Marginal Distribution Functions, Joint Density Function and its Properties, Marginal Density Functions, Conditional Distribution and Density – Point Conditioning, Conditional Distribution and Density – Interval conditioning, Statistical Independence, Sum of Two and more Random Variables, Central Limit Theorem: Equal and Unequal Distribution.		
MODULE - III	OPERATIONS ON MULTIPLE RANDOM VARIABLES – EXPECTATIONS	Classes: 09
Expected value of a function of multiple random variables, Correlation and Covariance , Correlation Coefficient, Joint Moments about the origin, Joint Central moments, Joint characteristic function, Joint moment generating function Jointly Gaussian random variables: Two random variables case and N random variable case, Properties, Transformations of Multiple Random Variables, Jacobian Matrix, Linear Transformations of Gaussian Random Variables		
MODULE - IV	RANDOM PROCESSES – TEMPORAL CHARACTERISTICS	Classes: 09
Random Process: Definition and Classification, Distribution and Density Functions, Stationarity and Statistical Independence., First- Order, Second- Order , Wide-Sense Stationarities (N-Order) and Strict-Sense Stationarity, Time Averages and Ergodicity, Mean-Ergodic and Correlation-Ergodic Processes, Autocorrelation Function and Its Properties, Cross-Correlation Function and Its Properties, Covariance Functions, Gaussian and Poisson Random Processes. Response of Linear Systems to Random Process input, Mean and MS value of System Response, Autocorrelation Function of Response, Cross- Correlation between Input and Output.		
MODULE - V	RANDOM PROCESSES – SPECTRAL CHARACTERISTICS	Classes: 09
Power Density Spectrum: Definition and Properties, Relationship between Power Density Spectrum and Autocorrelation Function, Cross Power Spectral Density: Definition and Properties, Relationship between Cross-Power Spectrum and Cross-Correlation Function, System Evaluation using Random Noise, Spectral Characteristics of System Response: Power Density Spectrum of Response, Cross-Power Density Spectra of Input and Output, Noise Bandwidth, White and Colored Noises
